METAGRO
CABINS FOR MINING

In mining industry, multiple potential dangers have to be taken into account, such as collapsion, dust nuisance, explosions and shock loads. The cabin's safety and the well-being of the operator are as important as the machine's productivity. Polluted air is filtered an dust is prevented from entering the cabin.

Vibrations and accelerations are bridled when vibration dampers are used in combination with our Heavy Duty Seat. The improved well-being of the operator increases his productivity and reduces costs.
